PDCR E1 Batch:

Case Study On:

The Volkswagen Emissions Scandal (2015): An engineering ethics case involving "defeat devices." Students discuss the legality and morality of writing code explicitly designed to cheat regulatory compliance tests.

PDCR F1 Batch:
A Case Study On:

The Knight Capital Group Trading Glitch (2012): A software deployment nightmare where dead code left on a server was accidentally triggered, causing a $440 million loss in 45 minutes. It emphasizes DevOps best practices, configuration management, and dead-code elimination.

How to do Case Study:

1. **Assign a Failure:** Provide a technical overview of a real system failure. When – How – Why it is happened..???

2. **Remove Blame:** Instruct students not to focus on *who* made the mistake, but *why* the system allowed the mistake to happen.

3. **Redesign:** Have students propose architectural, testing, or process changes to prevent the failure from ever recurring.
